I did it, but theide from uvs crashes too often on my ubuntu, it has some memory leak that it's not so easy to find without knowing very well all the packages. OTOH, the stable version is rock solid. That's a pity, because the uvs release has many enhancements....

Plus, I've tried uvs version one month ago and it had a problem with ASM code which forced me to use gcc v3.3 (which is slow on compiling...), and changing the compiler version drives upp crazy, so it is necessary to delete ~/.theide directory entirely every time compiler version is changed (I've tried deleting single files and combinations of them inside ~/.theide, but nothing worked)

Right now I can't get last uvs version. I've tried to connect to the new uvs server in the last 3 days without results - Does anybody have the same problem (or have I miscalculated the new IP)?

David
