Does not run, but that is due to libexpat having been moved/upgraded. I temporarily made

```
# sudo ln -s /opt/local/lib/libexpat.1.5.0.dylib libexpat.0.dylib
```

so at least you can launch it.

But it does not run well, lots of painting bugs, no text in the log output window etc.

I am currently rebuilding it, to see if it will work better.
