[View Forum Message](#) <> [Reply to Message](#)

is a variant with "message" parameter (which replaces the condition in the failure messagebox / output log).

E.g.:

```
static const RichValueRep *RichValueRep::Cast(const Value::Void *p) {
    ASSERT_(dynamic_cast<const RichValueRep *>(p),
        String().Cat() << "Invalid value conversion "
            << typeid(*p).name() << " -> " << typeid(T).name());
    return (const RichValueRep *) p;
}
```

-> U++ will now tell you what is wrong with your Value conversions...
