Hello everybody,

I also have the debug problem with 2007.1 release using MINGW. I have double check all my

stop the code at a certain breakpoint. Is this behavior normal? Is there a manual that explain what steps you have to perform in order to make the IDE to work correctly?

Please excuse my ignorance but in my opinion someone new trying U++ will not waste time to configure something by guessing.

I known you guys put a lot of work in this great project but in my opinion you have to come much closer to the user, and to provide some documentation, this way you will avoid a lot of inutile questions that arrive on forum. Also please note that not everybody is an expert in OOP.

What I see now missing is an installation guide and a more detailed description for main objects that you provide (like TopWindow) and how these objects interact between them.

Thanks,
Atlas
