Create empty package in "Set main package", do "Project/Main package configuration" and insert empty line there (so the package will be visible in Set main package by default).

Now add source files of the library.

Try to compile. Fix all includes/compile errors until it works.

Open other package with application, do "Use package" on it, and add your new package. Correct include paths (`#include <PackageName/somelib.h>`) in application.

It may work, or you may run into lot of small problems with compilation... depends how clean the library source is and how well it will fit into Ultimate package.

edit: and read probably some basic help on packages firstly.
