just for the record, the last svn-version I tried did show the "writing to freed memory" message, even on windows, and naturally again changing the magical number in freefill() and freecheck() to zero did get rid of this critical error-message.

as for uvs, I guess it's less work to implement a new context-menu option for downgrading all files to a particular version than to write good svn-updating cron-job which does actually work together with uvs automatically. also, in the context of this particular project, a weekly update isn't as big as to corrupt the built whenever downgrading some particular file, in my experience. but my experience is very limited though. I just don't like going online whenever I have some regression-testing to do...
