Well, as of const, I generally tend to think that while initially it feels like plague, after a while you can find it quite useful, at least to describe the interface better.

Been through it ages ago....

me too.... at the beginning I found it boring and annoying stuff, now I find it very useful. The bad thing is that c++ allow you to recast const to non-const... so a badly written library can do what he wants.

Well, but that is useful feature and this is one of things I like with C++ - the "default" mode is "safe", but you can always do dirty things when you need them.

In other words, you can also say that a well written library can do what it needs

Actually, interestingly it seems like I am the only one here who in fact likes C++ as it is (except some quite small issues and the standard library, which IMO only looks like a good design).
