This is not possible yet. We were thinking about extending Convert interface (each edit uses it) that would allow to do that. I don't know when it'll be done as this change would cause backward compatibility problems.

From the other side upp prefers allowing the user to input any string - (keyboard filtered is acceptable) and to display immediate error (edit changes color of the background to red) when edit's data is not correct (you just pass ErrorValue to edit in your callback) and display detailed error message when dialog OK button is pressed. Just override bool Accept() of your control to display your own messages.
