hi,

i see a small problem in EyeCare and it is the time for relaxing is stated to be "Minutes" where as it is in "Seconds".

At first this would be a problem but it should be taken care of because:

- 1) My first opinion was that there is some thing wrong in u++ working with system tray ... (which was not which i realized later)
- 2) Even when I checked the time options it showed Minutes as unit which strengthened my opinion that some thing wrong in working with system tray ... (which was not which i realized later)

the refresh was just about every 5 sec of hiding the app, so this hinted me the possible reason.

... sorry for nagging it out but i feel that a lot of new people (especially those who want to work with "system tray" and picture display i.e "ImageCtrl" do look at this example instinctively)
.... or thats what i feel.

I would suggest to change Minutes Text to Seconds in Debug mode and slightly increase the default time to 30 seconds with a bright notification picture ... If I get time i'll would sure redo the application(not very soon thou).

.. it seems that it was on purpose that the Minute was reduced to seconds

```
#ifdef _DEBUG
#define MINUTE_M 1000 // to reduce waiting when debugging....
#else
#define MINUTE_M 60 * 1000
#endif
```

but i think on the first look, as i saw it would be not so great to have and actual time should be mentioned.
