I am using upp for 3 weeks now, and I really like the way its setup. IMHO the approach to c++ is unique, refreshing and absolutly brilliant.

What I really missed though is good documentation. Everything is spread around, or so it feels for the beginner. Therfor my start was a bit hard especially since I use TheIDE under linux.

I think that a good Wiki could help with that, it's an easy way to reference to existing manuals or forum posts. There wouldn't be any need to rewrite old material, just copy'n'paste it. Even from Topic++ where needed. Also adding content is a lot easier for most people and nowadays even familiar.

I would seriously suggest closing anonymous posting, especially with so little activity.

Also there needs to be a small basis to work on, right now its just 'installed'. If you need a maintainer I might be interested if you want to continue with it. Its good practice for me too
