mrjt wrote on Thu, 03 January 2008 05:09 Sorry about the late reply, I've been holidaying all festive season

The reason for not using XConfigureNotify is that there is no way to identify the final move/resize event (ie when the user has moved the window and then released the mouse button).

Do you mean that the problem is that you cannot tell which XConfigureNotify is final?

What about simply testing global mouse button status? When all mouse buttons are released, XConfigureNotify is final, IMO.

Mirek
