Is there any facility in U++ that makes it possible to have dynamic variable names and variable types?

I'm parsing a config file and it'd be nice to have the specified config variables be used in the parser. I know in scripting languages, such as PHP, that it is possible to have:

```
$var = "real_var";  
$$var = "foo and bar";  
echo $real_var;
```

and the output would be "foo and bar".

Thanks.
