The code comes in the bazaar section of the SVN, and I hope that once it's more polished it will be added to the officially numbered distributions (probably as a separate package like GridCrl), but that's up to the U++ team.

Actually, Bazaar was already shipped with last "dev", also somewhat hidden (no assemblies).

It is actually an interesting question about integrating it:

- first, should it be placed as another nest in the MyAppS assembly ("c:\MyApps;c:\upp\bazaar;c:\upp\uppsrc")?
- then, perhaps it should be divided into Bazaar and BazaarExamples, and BazaarExamples assembly precreated.
- also, I think it would be a good idea to write some description of package that would clearly designate it as Bazaar part, and with info about author(s). "Bazaar: Docking, by James Thomas"
