cbpporter wrote on Fri, 18 January 2008 10:33Hi!

I was trying to determine how to obtain the skin from the OS (under Windows), so I though that I'd install WindowBlinds, try out some skins and determine the limits of U++'s Chameleon.

Everything went pretty good and most stuff got skined somewhere between good and great (except for menus, which where universally very bad)

Screenshot? Have you tried latest sources? A lot of effort went into this over recent weeks.

, but I have run into serious issues with the skin Classic, from Stardock Design (included in the evaluation package of WindowBlinds).

Any way how to try this?

Using this skin, all U++ applications lock up after a time, except the IDE. You can load up any app, and after playing a lot with the interface and especially dragging other windows on top of the U++ application freezes it. I noticed that if you put your cursor over the window border buttons, the are not animated, like in other apps, and almost inevitably freeze the application again. Also, windows have text which is not visible when window is focused. And the strangest part is, TheIDE is immune to these issues. Window caption is present and buttons are animated. Does U++ touch window drawing. Does TheIDE have some extra code for it's windows?

No.

Maybe it is debug vs release or compiler dependent? ("retail" IDE is build with MSC).

The Classic skin was the only one I found that triggered this bugs. It could be that there is something wrong with it. Still, other applications have no problems with it, and it would be great if U++ apps would not lock up if there is something wrong with the theme (considering the myriad of user themes on the Internet). I was using Windows Vista.

Definitely.

PS: I'm trying to find out how U++ obtains the skining information. Could you direct me in the right direction? I'm trying to get the look of some controls which U++ does not cover.

For Win32, it is concentrated in CtrlLib/ChWin32.cpp.
