
Subject: EditDouble causes crash in GridCtrl

I am finding that most of the time, when I want to be able to paste data from excel into GridCtrl, I need to use EditString because EditDouble fails. This is not always the case but seems to happen when I use an Array <EditDouble> m_edits say to add editing to a variable number of columns. I'm not sure why it happens. I think its a problem with EditDouble. Surely, rather than crashing, EditDouble should return 0.0 if the contents of the the EditDouble cannot be interpreted as a floating point number?

It just means that anyone wanting a robust input needs to code their own using EditString and interpret it using atof()

Am I missing something?

Nick

EDIT: ok so it asserts in debug and just fails to read in release. I don't understand why but I don't have time to fix it so I'll just use EditString instead.
