ezcomm/main.cpp line 209

i have a DropDownList hist_text_in. Its values are received messages and its keys are indexes in a corresponding address list. Thus, different items in the DropDownList can have same keys to point to same indexes. But when I select an item, if keys are same, I cannot locate the item using GetIndex() + GetValue() or anything.

then i suppose i should have another list/table correlating each address list index to DropDownList key. in this way, key can be made unique. but when the DropDownList is full, new items make old items disappear. thus i have no easy way to track items.
