I was thinking about a reimplementaion of Wt as well.

The idea is very-very good, but the current implementation and API of Wt are extremely complex, if you know U++ style of programming.

Btw I would prefer a much more simple design in the first iteration:

- * A scalable web server class (basically single threaded, but passing dynamic requests to threads)
 - * A simple infrastructure to handle requests, sessions
 - * An infrastructure to register cpp files and map them to URLs (something like test registration in UnitTest++)
 - * A simple templating engine to generate HTML.
-
