Some time ago I had an idea of making site. Yes, C++ would be very attractive way of making site (at least for me who knows C++ and doesn't know much of PHP).

The main problem I've met was actually not generating answers and parsing html (but that was a problem too). The main thing was supporting a number of browsers. This is very specific web-only thing, which requires strong JS+HTML+CSS experience. So, the thing actually required most was visual style of making site pages which would support different browsers without actually programming these differences. I mean something like the IDE template editor, but for pages (like Macromedia Dreamweaver visual editor?).

Cross-platform. Cross-browser.
