Sorry, I was inaccurate in my explanation. The problem requires that the `OverrideCursor()` is called from a context menu callback function to NOT to work. (I only thought of it as being a mouse operation as I used the mouse right clicking to open the context menu.)

Anyway, my fix does not appear to work on Linux as `SetMouseCursor` can not be called in static member function `OverrideCursor` without an object.

The reason the `DoCursorShape` does not work in this context is probably because the `DoCursorShape` requires an existing "mouseCtrl" which is not true in this case. So, I guess a proper fix would require a way to bypass a nonexistent mouseCtrl for an overridden mouse cursor. Or what do you think Mirek?
