Shouldn't we use the ProcessAffinityMask instead of the SystemAffinityMask to get the available cores?

Maybe... Should these be the samein most cases?

I haven't tested it but I think that they are not the same if you assign the process to an explicit processor with the taskmanager.

And I think the return value of this function should return the cores it can use and not the cores that are in the system..

Well, we are using "ProcessAffinityMask" now. IMO, that is what you suggest(?)
