---

I'm more or less new to linux. I don't understand how exactly I can do this.

I could unpack the rpm with rpmextract, but when I start theide it can't find the examples and the libraries path. So, how can I get it right?

Can you please provide a mini-tutorial showing which package to download and which commands to type to get U++ installed?

Thank you

EDIT: It seems I got it installed by unpacking to /usr and running theide.

The problem now is that I can't compile any U++ project.

The compiler can't find "bits/atomicity.h".
