Hello,

I have some problems with GUI en multithreading with U++.
My app crash when a thread modify the content of a lineEdit widget.

I think an other thread is trying to read data from this lienEdit to display it at the same time.

How can i disable updating events when i modify my widgets values ?

Thank you for your help

A simple example that produce the problem.

```
#include "mt.h"

void mt::theThread()
{
 while(true) {
  String text = console.Get();
  text << "Some Text\n";
  console.Set(text);
 }
}

void mt::startButtonEvent()
{
 Thread().Run(THISBACK(theThread));
}

mt::mt()
{
 CtrlLayout(*this, "Window title");

 startButton << THISBACK(startButtonEvent);
}

GUI_APP_MAIN
{
 mt().Run();
}
```

Only main thread can do GUI. You should use event queue and post callback that is supposed to update the widget.

Reading the widget content in a non-main thread is a bit of problem, I guess you should use shared variable that gets updated on Post event request (and is interlocked by Mutex).
