jlf franks wrote on Wed, 12 March 2008 12:03 It is not obvious to me how to make a selection of using ArrayCtrl or GridCtrl in a new application.

GridCtrl lacks in documentation is one factor, but not the most important one.

ArrayCtrl can interface to a database, but I'm not using a database.

My application requires 15-20 rows by 6 columns.

Each cell must be editable.

Column 1 is EditString ctrl

Column 2 - 5 is EditDouble ctrl

Column 6 is EditString ctrl

This is a touchscreen application where double click does not exist.

Is there a superiority of one type of control over the other?

--jlf

Well, I guess, GridCtrl is more traditional, "Delphi like" component.

ArrayCtrl might perhaps be more flexible if you need to e.g. have invisible indices (I mean, cells in line that are not visible) or combine several indices to single cell and similar things.

GridCtrl is better if you want high-level utilities.
