I went back to this. They recommended applocale, which might work, if you run XP, but is not supported on Win2k.

I tried various methods of wrapping IDE, etc, with .bat files that first set the codepage, #pragma for codepage, and setlocale() but nothing lets me compile upp.

We are forced to stay 7.1 until MS can solve it.

Lund

After some research... have you tried

```
#pragma setlocale("C")
```

?

Place it somewhere into Core/Core.h or Core/Defs.h...

This info indicates it should help...:

http://www.openoffice.org/issues/show_bug.cgi?id=36782

I would gladly place it into Core.h....
