Very nice, your transparent highlights work well (I think I might use that code ).

A few things:

- Besides the fact that panelicons would be better as an `Array<ImageCtrl>` (to avoid using `new/delete`), would it not be easier to just add the `Image` to the `ArrayCtrl` and set the display for that column to `ImageDisplay()`?
- It's a bit wierd that all the windows open as peer-windows, it would seem more natural to me for them to be child windows.
- Instead of `newlayoutdialog`, you could just use `Upp::EditText`.

James
