thank you.

BTW, as you words IF code like this:

```
::SendMessage(hwnd, WM_SYSCOMMAND, 0xf008, MAKELONG(0, 0));  
::SendMessage(hwnd, WM_LBUTTONDOWN, 0, MAKELONG(0, 0));
```

maybe a leftup send to the topwindow. Then if a ctrl there at (0,0) and accept this mouse event

...

So I think a relative location should be calculated.

In this leftdown function, as "SendMessage" work, the leftup will be called. It is a little strange.
