Hi everybody

I am new to this development software, and like to know the codes of writing a simple GUI to replace the dos command line statement, such as (COPY.EXE c:\source d:\output), where source and output are two parameters. I know it is quick to do it by batch file, but just want to learn something to start with.

Also, when we execute our application, there is always a new log file and old file created afterwards. Can we adjust the setting to get rid of it?

Regards

PC
