1. type the name of the ctrl then '.When'. As almost all callbacks are of the form WhenSomething this gives a list of the callbacks.
2. Check the source. Press Ctrl-Q, type EditField, then click on one of the options at the bottom of the screen to go to the header file.

In this case the action you want is default ctrl callback WhenAction, so:

```
editfield <<= THISBACK(OnChange);
```

or

```
editfield.WhenAction = THISBACK(OnChange);will work.
```

James
