C:\upp\uppsrc\Core\CharSet.cpp:1217: warning: unused variable 'b'

Also the -Wall switch for GCC throws many warnings in Core package, some of them can be easily fixed (like for example:

C:\upp\uppsrc/Core/Parser.h:2: warning: suggest parentheses around && within ||
)

I think it's not a good idea to change the source just ahead of full release, but I think this should be TODO item for next version; to minimize amount of warnings with -Wall switch.

And I did want to add -Wall to GCC compilation options, and figured out there's no way in Build methods setup, except adding it directly to debug/speed/size options, so some "global" options edit box would be nice IMO. (another TODO for next version?)
