## Subject: Re: Why each package should reside in its own directory?
Posted by Novo on Mon, 14 Apr 2008 15:01:11 GMT

I do have some experience in commercial software development

The problem is that the package system in its current state cannot be used to build non

projects, sometimes I need to improve these third-party libraries. That means that I cannot change structure of somebodies code because I want to keep that code up-to-date using different version control systems, and I cannot use TheIDE to build that code because it is non package-organized.

I also have approximately 50 my own libraries.  Many of them are package-organized, but several reside in one directory. Restructuring that bunch of code just to be able to build it under TheIDE is quite painful.

TIA
