Well, ListBox control is a simple widget. It doesn't need SQL integration, multiple columns, etc. I want to use it to control which columns are visible in GridCtrl widget.

```
|Stock(ListBox)|        |Current View(ListBox)|
----------------------------------------------
|Column2       |        |Column1          |
|Column3       |        |Column4          |
|ColumnX       |  <=    |Column5          |
|ColumnX       |  =>    |                 |
----------------------------------------------
```

In that case is better having a simple widget, because using ArrayCtrl or GridCtrl here and in other places where a ListBox is needed, will increase executable size.

It is possible to have something like Firefox "Grid" control have for hide its columns?
