I just replace the original theide.exe or I've to use the one built in the out directory ?

Invoke the one in the out directory using those commandline flags.

Quote:

Ok so I recompile my ide, export strings in all.tr, re-fill strings in it (arg, it's long), and re-import the all.tr in the ide. If all is Ok, I send the file back here. Right ?

If you have fixed strings in .t files, they should appear in the export from recompiled ide.

Actually, that export does just that - exports literal constants from .t files (compiled in binary). That is why you need to recompile...

TheIDE is then able to take such .tr file and import it back to .t files. So the normal path is "export .tr" -> "fix .tr" -> "import tr.". But of course, you do not want to do everything again, so at this moment, recompile and then export...
