Max

That would be useful. Especially because there is no adequate GUI tool for valgrind at the moment. I've been using valkyrie, which is QT-based, but it doesn't work with valgrind 3.3.0. vim is pretty good in handling of valgrind's output (as usual).

I'd like to mention that valgrind is just a framework. I was running a tool called memcheck, which is based on valgrind. There are other valgrind-based tools. Most popular beside memcheck are callgrind and helgrind.

memcheck can produce XML output. So, the only thing left is to parse that XML and put data into a grid or a tree.

There is a cool example of GUI for callgrind called kcachegrind.
