What a metaphysic question

Ihmo,

Ultimate++ is itself is a C++ Framework, a cross-platform C++ Framework. It's the generic definition.

Now, it's real that Ultimate++ provides cross-platform GUI Toolkit, but only as part of it (the Core package has nothing to do with UI).

thelde is a tool, an application developped with upp, and can be considered as a development suite. As far as I know, theelde isn't part of the upp framework, but is part of the Upp project .

So for me, the good denomination for Ultimate++ as a toolkit is a cross-platform C++ application framework with integrated cross-platform GUI.

Theelde is the Ultimate++ framework development tool.

The Ultimate++ project provides the Ultimate++ framework and theelde development suite.

My 2 cents

Riri
