Now I need to determine the current row & column. I found a GetCurrentRow (but no GetCurrentColumn), but the value which it returned seems to be off (and even constant in my case). There is also GetCursor, which returns (-1, -1)? And which is the event for cell change?

GetCursorPos return Point with currently pointed cell otherwise it returns Point(-1, -1). It should work. If not please give me some more information (calling context) or attach a test case.

And is there an easier way to do key/value stuff than using a Value and GridDisplay?

What you mean exactly? What do you want to achieve?
