Subject: Adding files from outside the home directory

Hi,

I have created several files with C++ Builder that also compile with g++. It would be great, if I could also use them in UPP. However, is it necessary to mention the full path of the header files in the cpp-file, because otherwise the header files are not found by the compiler?

E.g. there are two files (List.h and List.cpp) located at /media/wind/u/m/tpfiles/general/.

In List.cpp, I say: #include "List.h"

Unfortunately, this results in an error stating that the header file is not found.

In C++ Builder I can set a search path. This way, there is no need to mention the full path. I wonder how this is done in UPP?

Thank you,
Michel
