BTW, I did install svn280 on clean WinXP yesterday and I did notice couple of minor things:

- the included SDL lib is 1.2.13, but at official download page of U++ there's only 1.2.12 package.
 - after installation when the build methods are detected by that wizard, the SDL directory is not pre-filled. Why not? It's installed anyway in \$installdir/sdl
 - mingw optimal does use BLITZ + all static - looks like it works as expected, so it's not bug report, just to let you inform what's the default settings after install on clean machine.
-
