Hello friends,
I had installed Ubuntu hardy Heron 8.04 on my laptop using Wubi to compile some server.c and
client.c projects for my socket programming project on Linux OS.I was able to view the desired
results with the following commands.It's only that when I re-installed Ubuntu and MySQL
client-server,I'm getting the following gcc compiler errors that I didn't get before.Please help me
out.

gcc: server: No such file or directory

server.c:13:19: error: mysql.h: No such file or directory

server.c:47: error: (Each undeclared identifier is reported only once
server.c:47: error: for each function it appears in.)

 Please note that I've already run the command "sudo apt-get build-essentail"
The above command to compile mysql server worked like a breeze before but now it's giving me
the above errors.I'm really concerned about the gcc errors as remaining errors depend on
that.Please help me out guys.Thanks.
