Hi there!

I'm using a GridCtrl to display some SQL-Data. When i first create my GridCtrl and add some Columns, all columns have the same width.

If i call my creation-method again, all columns are at minimum size. Only the last column is very big.

This is how i create my GridCtrl:

```
GridCtrl datagrid;
```

```
void myApp::CreateDatagrid(String sqlTable)
```

```
{  
    datagrid.Reset();  
  
    if(sqlTable == "Kunden")  
    {  
        datagrid.AddIndex();  
        datagrid.AddColumn("NAME");  
        datagrid.AddColumn("NUMMER");  
        datagrid.AddColumn("PRODUKT");  
        datagrid.AddColumn("VERSION");  
        datagrid.AddColumn("STANDORT");  
        datagrid.AddColumn("ANBINDUNG");  
        datagrid.AddColumn("BEMERKUNG");  
    }  
    else if(sqlTable == "Server")  
    {  
        datagrid.AddIndex();  
        datagrid.AddColumn("KUNDE");  
        datagrid.AddColumn("ALIAS");  
        datagrid.AddColumn("HOSTNAME");  
        datagrid.AddColumn("DOMAENE");  
        datagrid.AddColumn("FUNKTION");  
        datagrid.AddColumn("IPADRESSE");  
        datagrid.AddColumn("PROTOKOLL");  
        datagrid.AddColumn("SYSTEM");  
        datagrid.AddColumn("VERSION");  
        datagrid.AddColumn("BEMERKUNG");  
    }  
}
```

I used a SqlArray before and didn't had this error.

This must be a very simple thing but i didn't get it.
