Ide droplist use different paint code. See find window.

Indeed, there is a template called WithDropChoice<> and it renders itself in a very similar way to what DropGrid looks like. So DropDownList (Multibutton) is the only exception here Vista seems to render its "native" comboboxes in both ways, depending on where you check. For example, Explorer renders the white version, while ODBC source setup uses more button-like look.

Well, in fact, I have observed (and reproduced, was quite hard work BTW, in fact the whole MultiButton class is dedicated to this purpose) this Vista rule:

If you can edit the content of field, buttons are white and become visible on hover.

Otherwise they are button-like - but in that case, the content is button-like too.
