Partial solution is to not use Option's Label (leave it empty) and put its text to Node's Value (haha, back at it again). Then clicking the option box will toggle the option, clicking the text will do selections.

You have to do it like this anyway, otherwise the Option obscures the highlight rect.

Quote:I am afraid this might not be consistent with interface behaviour e.g. in case there are EditFields in the TreeCtrl...

To be honest I think it makes as much sense as anything else in that situation, and it will only change behaviour when using multiselect and ctrls.

The existing way, where the current selection is cleared whenever a ctrl gets focus is broken. For instance, currently the selection is cleared if focus changes to another window then back again.

Quote:

What makes me wonder, BTW, is how the Option gets the focus?!

The sequence is:

LeftDown

DoClick

SetCursorLine

SetWantFocus on the ctrl

ChildGotFocus

SetCursorLine

SelectOne (obviously clears any other selected items)

Perhaps a better solution would be to stop the first CursorLine being called when using CTRL-key and multiselect, but the behaviour is definitely wrong.
