Well mrjt solution works as he said it would. Thank you! I don't need multiselect, so I guess we can leave ChildGotFocus as is.

I actually need the option to change it's checked status only when I click the small rectangle to the left, not the entire region of the control.

Quote:Partial solution is to not use Option's Label (leave it empty) and put its text to Node's Value (haha, back at it again . Then clicking the option box will toggle the option, clicking the text will do selections.

I'm not going back to that again .

I'll leave it as it is for now, because there are other strange behaviors that I didn't find a reason for yet. Getting the changed checked status of a item in the OptionTree that is not checked doesn't seem to work only after it has been changed. I'll investigate these and if they'll look like a bug, I'll post about them. I hope they are just some mistake of mine.
