Thanks for the tips Matthias.

I am using version 317 from svn Since I already had that on my Windows PC.
I used the Project Export function to create a makefile on the windows PC then copied over to the
Sun PC. Then modified the Makefile to use the proper include and lib directories.

I also found that Sun loads a version of the GNU utilities, so I was able to make use of them
instead of the Sun tools. I may try to use Sun's tools after I get the everything to build with the
GNU tools. A big issue I ran into is that "make" != "gmake", make complained about the ".tpp" files
while gmake had no problem.

I am off till Monday, so I won't be able to continue until then.

Once I get a successful build, I'll post my Makefile.

Dave
