
Subject: "and" and "or" are defines under Linux

I cross compiled something under Linux today, and I noticed that both "and" and "or" are defines and I get compilation error at something as simple as "int or;", because the compiler gets "int ||". I like "or" as a local variable name . This is only under GCC. If the defines are not necessary for U++, we should undef them, or at least define them under Windows, so we get consistent crosscompilation.
