Hello all,

Excuse me for my impatience ! But i want to know if improvement in theide debugger are envisaged.

I know this is not the priority but i'm using theide for some projects since 6 months and the debugger is for me the only thing which need to be improved.

I have always same problem.

- Add/remove breakpoints during execution doesn't work.
- Sometimes my program or/and theide is stucked.
- watching values is limited and it would be nice to show expression like `b.size()` or `b[index]` (where `b` is a STL container) (if it is not possible it would be really nice the debugging session was not broken adding expressions like these.)
- and some others little problems, ....

thanks for your answer.

cocob
