Yes.

As soon as the source code is good for easy build ("make" and "make install" with good parameters to be able to tell where to find headers and where to install), building a package is no more complicated then:

```
# rpmbuild -ta yourtarball.tar.gz
```

and you get an yourtarball-version.i586.rpm and yourtarball-version.src.rpm. On x86_64:
yourtarball-version.x86_64.rpm

I will checkout svn tonight and tell you what to fix the 2 U++ Makefile (a few fix I wrote already but for the official released source).
