Hello!

First of all, I'm using the version upp-mingw-712-dev1. I know that is not the latest, but I guess the thing, I ask about here should work there too.

I have to use STL and not NTL for a reason.

I want to use multimap. If I do the usual stuff:

```
#include <map>
std::multimap<int, double> mm;
```

This is a simple insert operation:

```
mm.insert( pair<int, double>(5, 5.0) );
```

Then I receive the following error message:

```
D:\MyApps\skeleton\MainWindow.cpp:386: error: `pair' undeclared (first use this function)
D:\MyApps\skeleton\MainWindow.cpp:386: error: (Each undeclared identifier is reported only once
for each function it
  appears in.)
D:\MyApps\skeleton\MainWindow.cpp:386: error: expected primary-expression before "int"
D:\MyApps\skeleton\MainWindow.cpp:386: error: expected primary-expression before "double"
```

It should work. Syntactically it is good. I tested it under MSVS2008. But what can be problem here?

Thx in advance!
