I'm very noob using UPP but i think this platform is really amazing.
I wrote this post because i have a doubt about CoWork; Its CoWork some kind of IOCP implementation?.
As you can know I/O completion port is an asynchronous mechanism provided directly by the OS kernel to manage I/O request. This technique y very efficient to manipulate thousands of clients in an client-server architecture.
How it works this mechanism is very similar to the work of CoWork (only a few threads to handle many operations), so for this reason i have this doubt.

thx in advance.
