Hi everybody.
I'm a newbie in U++ and I have a project that communicate to other device via rs232 or LPT. I want to place a switch (ratio box - i think so ), or droplist (combo box - sure). When an user choose one, program will set a variant (ex: user choose com1, so port = com1), but I don't know what to do. No example and reference programs about this.
Help me, please
