Some kind of script?

Problem: Mandriva use urpmi. Redhat use yum. Suse use something else I think. I haven't find a way to download files automatically from U++ forum.
Here are instructions without comments for advanced users (replace urpmi by yum, ...):

su
urpmi rpm-build freetype2-devel gtk2-devel pango-devel atk-devel cairo-devel X11-devel xft2-devel expat-devel
exit

cat > ~/.rpmrc << EOF
buildarchtranslate: i386: i586
buildarchtranslate: i486: i586
buildarchtranslate: i586: i586
buildarchtranslate: i686: i586
EOF

cat > ~/.rpmmacros << EOF
%_topdir $HOME/rpm
%_tmppath $HOME/rpm/tmp
%distribution Linux
%vendor Ultimate++ team
%packager YourName YourLastName <youremail@provider.loc>
EOF

mkdir -p   ~/rpm/{BUILD,RPMS/{i586,x86_64,noarch},SOURCES,SRPMS,SPECS,t mp}

cd ~/rpm/SOURCE/
wget -N   http://dfn.dl.sourceforge.net/sourceforge/upp/upp-src-2008.1 .tar.gz

Download and save the tarball you will find at the end of this message. Then uncompress it with this command:

tar zxvf rpmscript_and_fix.tar.gz -C ~/

That's all. To create the source and binary rpm packages:

rpmbuild -ba ~/rpm/SPEC/upp.spec

Simple enough?
